

**PATENT APPLICATION**

**METHODS, SYSTEM, SOFTWARE AND GRAPHICAL USER INTERFACE  
FOR PRESENTING MEDICAL INFORMATION**

**ABSTRACT OF THE DISCLOSURE**

5           Various methods, systems, software and graphical user interfaces are described herein  
to enable a medical provider to generate forms and reports customized to a particular patient's  
medical conditions. When a medical professional treats a patient, the invention disclosed  
herein permits a customized dynamic form to be presented to the medical provider, either in  
print or via a computer graphical user interface, wherein the form includes information related  
10       to the particular medical conditions of a that patient. Unlike "one size fits all" forms  
commonly provided to doctors or other medical professionals, forms and reports as taught  
herein permit medical professionals to see "the big picture" by having substantially all  
information relevant to a patient's medical condition in a unified format. Various  
embodiments discussed herein permit changing a form interactively based on a current  
15       diagnosis, and generating customized patient reports.
